Not illustrated. 1868 Excerpt: .of them by a constant, the number of independent equations is, in fact, one less than that of the unknown quantities, and the problem becomes indeterminate. This difficulty does not arise from the method by which the normal equations are formed, but from the nature of the given equations of condition. In any such case, additional observations are necessary, for which the coefficients have such varied values as to lead to independent equations. Even when two equations cannot be reduced precisely to a single one by the introduction of a constant factor, if they can be made very nearly identical, the problem is still practically indeterminate. The indetermination will become evident in the actual elimination in practice when any one of the unknown quantities comes out with so small a coefficient that small errors in the observations would greatly change this coefficient. (See Art. 52.) Vol. II.--33 32. By whatever method the elimination is performed, we shall necessarily arrive at the same final values of the unknown quantities; but, when the number of equations is considerable, the method of substitution, with Gauss's convenient notation, is universally followed; but, for the present, leaving the reader to choose his method, I proceed to explain the principles by which the mean errors of the values of x , y , z . are determined. MEAN ERRORS AND WEIGHTS OF THE UNKNOWN QUANTITIES. 33. Since we have put $n = l - M$, $n = l - M$, c . (Art. 28), the mean...
